titles plants grow Brazil start morango Fenix Producers Atibaia April Embrapa Sandro Bonow  
"Essa new variety is part of Embrapa's morangueiro breeding program. Our goal is to provide Brazilian farmers with national cultivars. Currently, Brazil is highly dependent on morango varieties developed in the United States and Spain," says Bonow.

"The Fenix is a variety that was developed in Brazil and has been tested in several locations in the country, including Atibaia, where it adapted well. With this, the producers received thousands of seedlings and have been working to start planting until next April,"

"With greater sweetness, greater resistance to pests and diseases, and longer shelf life, the Fenix is expected to produce fruit between June and August, extending the morango production period," Bonow says, noting that the new variety was registered and is ready to be marketed.

"Farmers are our partners, and we work together to identify what's good for them and the production chain. They have been participating in the development and tests, and now we've made the seedlings available. They're in the fields, and planting will start at the next planting season," he says.

One of the main goals of creating the Fenix was to produce a morango that renders more in Brazil.

"We developed the Fenix as an alternative to reduce dependence on imported varieties and optimize production costs. Today, the Brazilian morango crop is largely dependent on American and Spanish varieties," says Bonow.

Besides being sweeter, it lasts longer on supermarket shelves and in gelators - up to five days - without losing quality," says Sandro.

Other characteristics of the BRS DC25 include:

- \* Average weight of 23 grams
- \*Red color
- \*Good shelf life
- \*Good transportation resistance
- \*Firmer texture
- \*Suitable for fresh consumption

The new variety promises to be a game-changer in Brazil's morango production, with greater sweetness, more significant resistance to pests and diseases, and longer shelf life. By providing farmers with a viable, productive, and profitable alternative to imported varieties can reduce production costs and increase the profitability of Brazilian farmers. The Fenix is a milestone in Embrapa's breeding program and represents a promising future for Brazil's morango industry.

New morango variety promises higher productivity and profitability for Brazilian farmers

The Brazilian Agricultural Research Corporation (Embrapa) has developed a new morango variety, the BRS DC25 Fenix, which promises to revolutionize the country's morango production.

The variety was developed in Brazil, adapting to the country's climatic conditions, and has been tested in several locations, including Atibaia, where it showed great adaptation.

The new morango variety, Fenix, stands out for its greater sweetness, longer shelf life, and resistance to pests and diseases. Compared to other varieties, such as the San Andreas, the Fenix has a sweeter taste, more significant resistance to pests and diseases and longer shelf life - up to five days - without losing quality.

According to Sandro Bonow, a researcher at Embrapa, the Fenix is a variety that was developed to meet the preferences of Brazilian consumers. "We developed the Fenix as an alternative to reduce dependence on imported varieties and optimize production costs. Today, the Brazilian morango crop is largely dependent on American and Spanish varieties," he says.

The Fenix is part of Embrapa's morangueiro breeding program, with the goal of providing Brazilian farmers with national cultivars. The new variety should start production this year, and producers in Atibaia have already received thousands of seedlings. Planting will start in April, with fruit production expected between June and August, extending the morango production period.

"Farmers are our partners, and we work together to identify what's good for them and the production chain. They have been participating in the development and tests and now we've

made the seedlings available. They're in the fields, and planting will start at the next planting season," Bonow says.

The success of the Fenix is essential for Brazil's morango industry, which has been facing challenges due to high production costs and dependence on imported varieties. "With the new variety, we will have a more robust production chain, with greater profitability for farmers, and more availability of the fruit in the domestic market," says Bonow.

Embrapa's breeding program has been working to improve morango production in Brazil. "Our goal is to provide Brazilian farmers with cultivars that can adapt to the country's different climatic conditions and optimize production costs," Bonow explains.

The Fenix is a significant achievement for Embrapa's breeding program and will likely impact Brazil's morango industry for years. The new variety should reduce dependence on imported varieties, reduce production costs, and increase the profitability of Brazilian farmers. The Fenix is a promising future for the country's morango industry, providing farmers with a productive and profitable alternative.

The start of planting the BRS DC25 Fenix seedlings in April will kickstart a new era in Brazil's morango production. By providing farmers with a national cultivar that adapts to the country's climate, the breeding program aims to reduce production costs and increase farmers' profitability. With the new variety, Brazil can expect a more resilient, productive, and fruitful morango industry in the years to come.

For farmers like Paulo Sérgio, who works in partnership with Embrapa, the BRS DC25 Fenix represents a breakthrough. "I am very excited about the new variety, mainly because it is developed here in Brazil, and this shows an adaptation to our conditions," he declares. "I believe it will be easier to market and more profitable because of the longer shelf life."

By providing farmers with a productive and profitable alternative to imported varieties, the Fenix promises to reduce production costs and increase the profitability of Brazilian farmers. The new variety is an advancement for Brazil's morango industry, providing greater sweetness, more durable opposition to pests, diseases, and longer shelf life.

The Brazilian Agricultural Research Corporation (Embrapa) launched the BRS DC25 Fenix, a novel morango variety appropriate for cultivation in Brazil. This intriguing revelation denotes a significant turning point and progress within the nation's morango production. Featuring a memorable taste and a longer shelf life, the Fenix increases the bar for Brazilian farmers. With the aim of endowing farmers with national cultivars, Embrapa created the Fenix.

Additionally, it presents a noteworthy advancement in generating more revenue for Brazilian farmers, minimizing the concentration on imported kinds from the United States and Spain. The adaptation of the BRS DC25 Fenix to the environment offers a promising possibility for sustainable development within the agro-productive chain. "We developed the Fenix as an alternative to reduce dependence on imported varieties and optimize production costs. Today, the Brazilian morango crop is largely dependent on American and Spanish varieties," Bonow explains. Apart from its extended productive life, raised host protection, and improved sugariness, the BRS DC25 Fenix possesses highly prized qualities. It's also crucial to note the importance of plant resistance to diseases and pests to ensure long-term success and maintain the health of the agricultural field. The BRS DC25 Fenix represents a substantial leap forward in Embrapa's morangueiro breeding program. A distinctive and creative advancement in Embrapa's variety development initiatives for the Brazilian morango industry, this novel selection guarantees sweeter fruit, increased resistance to pests & diseases, and a longer shelf life.

Advanced agricultural methods, such as cutting-edge crop cultivars that adapt to Brazil's varied climate, highlight the need for self-sufficiency in national agricultural output. With the BRS DC25 Fenix, Embrapa opens the door to more wealth and self-sufficiency in the area of morango production, establishing a healthy legacy for future harvests. Its sweeter flavor, improved illness & pest protection, and longer shelf life make it a positive effect on Brazil's industrial and agricultural outlook.

Investing in agricultural study is necessary to construct a sustainable and self-sufficient future.

The creation of the BRS DC25 Fenix assists in reducing reliance on imports, boosting local production, and improving the industry's strong growth. To achieve greater independence and preserve the agro-productive chain's durability, we must keep funding the growth and development of local cultivars. The invention of the BRS DC25 Fenix cultivar has set a fantastic precedent for creating inventive, modern, and environmentally friendly farming methods. We can boost agricultural output and create a more prosperous, self-sufficient future by continuing to support research. "Sustainable practices and less dependency on imports will ensure long-term growth and success in the agro-productive chain."

The BRS DC25 Fenix represents a significant advancement in cultivar development, emphasizing the significance of fostering innovative thinking and investigating an increased emphasis on agricultural research and development in Brazil. The potential for incorporating cutting-edge techniques into agriculture is enormous, as seen by the development of the BRS DC25 Fenix. By prioritizing environmentally friendly practices and reducing reliance on imported varieties, we secure a prosperous future for ourselves and the generations to come.

The BRS DC25 Fenix is developing a more durable future of agribusiness. This ground-breaking advancement symbolizes a promise for a prosperous future that supports environmental care, sustainability, and the advancement of best practices in Brazil's agricultural development.

The launch of the BRS DC25 Fenix cultivar is a substantial move toward lowering reliance on imported kinds and boosting the competitiveness of Brazilian farmers. As we herald a new chapter in the sector, it is essential to develop local cultivars through cutting-edge methods. Together, we construct a self-sufficient and resilient future that decreases reliance on foreign varieties, maximizing profitability. As we maximize production and work toward stability and national self-sufficiency, we construct a wealthy and long-lasting legacy that benefits present and future age groups.

Empowering the agriculture industry with innovative solutions is Embrapa's goal since it prioritizes agricultural study and embraces innovation. The BRS DC25 Fenix Moranguero Project conveys our commitment to producing food while protecting the environment and boosting output," remarks Dr. Ricardo Antonopoulos, president of Embrapa.
